Docket No.: R2180.0189/P189

## **AMENDMENTS TO THE CLAIMS**

- 1. (Original) A semiconductor device, comprising:
- a P-type semiconductor substrate;
- a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor substrate and a source formed in the P-type semiconductor substrate on a main surface of the P-type semiconductor substrate; and
- a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region.
- 2. (Original) The semiconductor device as defined in claim 1, wherein the P-type semiconductor substrate comprises a P-type high concentration semiconductor substrate and a first P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to the main surface of the P-type semiconductor substrate, and the first P-type low concentration epitaxial layer being disposed over the P-type high concentration semiconductor substrate.
- 3. (Original) The semiconductor device as defined in claim 2, wherein the N-type region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the P-type high concentration semiconductor substrate and the first P-type low concentration epitaxial layer.
- 4. (Original) The semiconductor device as defined in claim 3, wherein the N-type region further comprises at least two side portions, each including an Nwell region, to form a structure such that the P-type region is surrounded by the Nwell regions and the N-type buried layer.

Application No. 10/769,817

Docket No.: R2180.0189/P189

5. (Original) The semiconductor device as defined in claim 2, wherein the first P-type low concentration epitaxial layer includes a P-type buried layer disposed under a region where the source of the P-channel DMOS transistor is formed.

- 6. (Original) A semiconductor device, comprising: a P-type semiconductor substrate including a P-type high concentration semiconductor substrate, a first P-type low concentration epitaxial layer, and a second P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to the main surface of the P-type semiconductor substrate, the second P-type low concentration epitaxial layer being disposed over the P-type high concentration semiconductor substrate, and the first P-type low concentration epitaxial layer being disposed over the second P-type low concentration epitaxial layer; a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor substrate and a source formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate; and a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region, wherein the N-type region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the first P-type low concentration epitaxial layer and the second P-type low concentration epitaxial layer.
- 7. (Original) A semiconductor device, comprising: a P-type semiconductor substrate including a P-type high concentration semiconductor substrate, a first P-type low concentration epitaxial layer, a second P-type low concentration epitaxial layer, and a third P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to the main surface of the P-type semiconductor substrate, the second P-type low concentration epitaxial layer being

disposed over the P-type high concentration semiconductor substrate, the third P-type low concentration epitaxial layer being disposed over the second P-type low concentration epitaxial layer, and the first P-type low concentration epitaxial layer being disposed over the third P-type low concentration epitaxial layer; a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor substrate and a source formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate; and a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on a main surface of the P-type semiconductor substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region, wherein the Ntype region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the second P-type low concentration epitaxial layer and the third P-type low concentration epitaxial layer, and the P-type region comprises a bottom portion including a P-type buried layer which is disposed at an interface of the first Ptype low concentration epitaxial layer and the third P-type low concentration epitaxial layer.

8. (Currently amended) A semiconductor device, comprising:

an N-type semiconductor substrate <u>comprising a first N-type low concentration</u> region over an N-type high <u>concentration substrate region</u>;

an N-channel DMOS transistor disposed on the N-type semiconductor substrate and including a drain formed of the N-type semiconductor substrate and a source formed in the N-type semiconductor substrate on a main surface of the N-type semiconductor substrate; and

a CMOS transistor disposed on the N-type semiconductor substrate and including an N-channel MOS transistor formed in a P-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate and a

Docket No.: R2180.0189/P189

P-channel MOS transistor formed in an N-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate, the N-type region being electrically isolated from the N-type semiconductor substrate by the P-type region.

- 9. (Currently amended) The semiconductor device as defined in claim 8, wherein the N-type semiconductor substrate comprises an N-type high concentration semiconductor substrate and a first N-type low concentration region is an epitaxial layer, the N-type high concentration semiconductor substrate being disposed opposite to the main surface of the N-type semiconductor substrate, and the first N-type low concentration epitaxial layer being disposed over the N-type high concentration semiconductor substrate region.
- 10. (Original) The semiconductor device as defined in claim 9, wherein the P-type region comprises a bottom portion including a P-type buried layer which is disposed at an interface of the N-type high concentration semiconductor substrate and the first N-type low concentration epitaxial layer.
- 11. (Original) The semiconductor device as defined in claim 10, wherein the P-type region further comprises at least two side portions, each including an Pwell region, to form a structure such that the N-type region is surrounded by the Pwell regions and the P-type buried layer.
- 12. (Original) The semiconductor device as defined in claim 9, wherein the first N-type low concentration epitaxial layer includes an N-type buried layer disposed under a region where the source of the N-channel DMOS transistor is formed.
  - 13. (Original) A semiconductor device, comprising:

an N-type semiconductor substrate including an N-type high concentration semiconductor substrate, a first N-type low concentration epitaxial layer, and a second N-type low concentration epitaxial layer, the N-type high concentration semiconductor substrate being disposed opposite to a main surface of the N-type semiconductor substrate, the second N-type low concentration epitaxial layer being disposed over the N-

type high concentration semiconductor substrate, and the first N-type low concentration epitaxial layer being disposed over the second N-type low concentration epitaxial layer;

an N-channel DMOS transistor disposed on the N-type semiconductor substrate and including a drain formed of the N-type semiconductor substrate and a source formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate; and

a CMOS transistor disposed on the N-type semiconductor substrate and including an N-channel MOS transistor formed in a P-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate and a P-channel MOS transistor formed in an N-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate, the N-type region being electrically isolated from the N type semiconductor substrate by the P-type region, wherein the P-type region comprises a bottom portion including a P-type buried layer which is disposed at an interface of the first N-type low concentration epitaxial layer and the second N-type low concentration epitaxial layer.

## 14. (Original) A semiconductor device, comprising:

an N-type semiconductor substrate including an N-type high concentration semiconductor substrate, a first N-type low concentration epitaxial layer, a second N-type low concentration epitaxial layer, and a third N-type low concentration epitaxial layer, the N-type high concentration semiconductor substrate being disposed opposite to a main surface of the N-type semiconductor substrate, the second N-type low concentration epitaxial layer being disposed over the N-type high concentration semiconductor substrate, the third N-type low concentration epitaxial layer being disposed over the second N-type low concentration epitaxial layer, and the first N-type low concentration epitaxial layer; being disposed over the third N-type low concentration epitaxial layer;

an N-channel DMOS transistor disposed on the N-type semiconductor substrate and including a drain formed of the N-type semiconductor substrate and a source formed

in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate; and

a CMOS transistor disposed on the N-type semiconductor substrate and including an N-channel MOS transistor formed in a P-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate and a P-channel MOS transistor formed in an N-type region formed in the N-type semiconductor substrate on the main surface of the N-type semiconductor substrate, the N-type region being electrically isolated from the N-type semiconductor substrate by the P-type region, wherein the P-type region comprises a bottom portion including a P-type buried layer which is disposed at an interface of the second N-type low concentration epitaxial layer and the third N-type low concentration epitaxial layer, and the N-type buried layer is disposed on a bottom of the N-type region disposed at an interface of the first N-type low concentration epitaxial layer.

## 15. (Original) A semiconductor device comprising:

a fixed voltage circuit comprising: a P-type semiconductor substrate; an output transistor including a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor substrate and a source formed in the P-type semiconductor substrate on a main surface of the P-type semiconductor substrate; and

a controller including a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region, wherein the controller is configured to compare an output voltage from the output transistor with a reference voltage and provide feedback such that the output voltage remains constant.

16. (Original) The semiconductor device as defined in claim 15, wherein the P-type semiconductor substrate comprises a P-type high concentration semiconductor substrate and a first P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to the main surface of the P-type semiconductor substrate, and the first P-type low concentration epitaxial layer being disposed over the P-type high concentration semiconductor substrate.

- 17. (Original) The semiconductor device as defined in claim 16, wherein the N-type region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the P-type high concentration semiconductor substrate and the first P-type low concentration epitaxial layer.
- 18. (Original) The semiconductor device as defined in claim 17, wherein the N-type region further comprises at least two side portions, each including an Nwell region, to form a structure such that the P-type region is surrounded by the Nwell regions and the N-type buried layer.
- 19. (Original) The semiconductor device as defined in claim 16, wherein the first P-type low concentration epitaxial layer includes a P-type buried layer disposed under a region where the source of the P-channel DMOS transistor is formed.
  - 20. (Original) A semiconductor device, comprising:

a fixed voltage circuit, comprising: a P-type semiconductor substrate including a P-type high concentration semiconductor substrate, a first P-type low concentration epitaxial layer, and a second P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to a main surface of the P-type semiconductor substrate, the second P-type low concentration epitaxial layer being disposed over the P-type high concentration semiconductor substrate, and the first P-type low concentration epitaxial layer being disposed over the second P-type low concentration epitaxial layer;

an output transistor including a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor

substrate and a source formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, and

a controller including a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region, wherein the N-type region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the first P-type low concentration epitaxial layer and the second P-type low concentration epitaxial layer.

## 21. (Original) A semiconductor device, comprising:

a fixed voltage circuit, comprising: a P-type semiconductor substrate including a P-type semiconductor substrate including a P-type high concentration semiconductor substrate, a first P-type low concentration epitaxial layer, a second P-type low concentration epitaxial layer, and a third P-type low concentration epitaxial layer, the P-type high concentration semiconductor substrate being disposed opposite to a main surface of the P-type semiconductor substrate, the second P-type low concentration epitaxial layer being disposed over the P-type high concentration semiconductor substrate, the third P-type low concentration epitaxial layer being disposed over the second P-type low concentration epitaxial layer, and the first P-type low concentration epitaxial layer;

an output transistor including a P-channel DMOS transistor disposed on the P-type semiconductor substrate and including a drain formed of the P-type semiconductor substrate and a source formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate; and

a controller including a CMOS transistor disposed on the P-type semiconductor substrate and including a P-channel MOS transistor formed in an N-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor

Application No. 10/769,817

substrate and an N-channel MOS transistor formed in a P-type region formed in the P-type semiconductor substrate on the main surface of the P-type semiconductor substrate, the P-type region being electrically isolated from the P-type semiconductor substrate by the N-type region, wherein the N-type region comprises a bottom portion including an N-type buried layer which is disposed at an interface of the second P-type low concentration epitaxial layer and the third P-type low concentration epitaxial layer, and the P-type buried layer is disposed on a bottom of the P-type region disposed at an interface of the first P-type low concentration epitaxial layer and the third P-type low concentration epitaxial layer.

Docket No.: R2180.0189/P189

22. (Withdrawn) A method of forming a semiconductor device, comprising the steps of:

forming a first P-type low concentration epitaxial layer over a P-type high concentration semiconductor substrate;

implanting an N-type impurity into a CMOS formation region of the first P-type low concentration epitaxial layer to form an N-well region;

implanting a P-type impurity into an NchMOS transistor formation region of the first P-type low concentration epitaxial layer to form a Pwell region;

forming LOCOS oxide layers on the first P-type low concentration epitaxial layer;

forming a first gate oxide layer on the Nwell region; forming a second gate oxide layer on the Pwell region;

forming a third gate oxide layer on the first P-type low concentration epitaxial layer;

performing channel doping implant into the Nwell region and the Pwell region;

depositing a polysilicon layer over the semiconductor substrate, which in turn has disposed thereon an oxide layer to form an N-type polysilicon layer;

Docket No.: R2180.0189/P189

patterning the polysilicon layer to form a first gate electrode, a second gate electrode in the NchMOS transistor formation region, and a third gate electrode;

masking the third gate electrode to selectively implant an N-type impurity into the first P-type low concentration epitaxial layer of the PchDMOS transistor formation region;

performing thermal processing to form a first N-channel diffusion layer;

masking the first and third gate electrodes to selectively implant a P-type impurity into source formation regions in the first Nwell region of the PchMOS transistor formation region, the first N-channel diffusion layer of the PchDMOS transistor formation region, and the first and third gate electrodes;

masking the second gate to selectively implant an N-type impurity into the first Pwell region of the NchMOS transistor formation region and the N-type high concentration diffusion layer formation region of the first N-channel diffusion layer in the PchDMOS transistor formation region;

performing thermal processing to form the first P-type high concentration diffusion layers, N-type high concentration diffusion layers on the Pwell region, and the first N-type high concentration diffusion layer and the second P-type high concentration diffusion layers on the first N-channel diffusion layer.

- 23. (Withdrawn) A semiconductor device, comprising:
- a first-polarity-type semiconductor substrate;
- a first-polarity-channel DMOS transistor disposed on the first-polarity-type semiconductor substrate and including a drain formed of the first-polarity-type semiconductor substrate and a source formed in the first-polarity-type semiconductor substrate on a main surface of the first-polarity-type semiconductor substrate; and
- a CMOS transistor disposed on the first-polarity-type semiconductor substrate and including a first-polarity-channel MOS transistor formed in a second-polarity-type

region formed in the first-polarity-type semiconductor substrate on the main surface of the first-polarity-type semiconductor substrate and a second-polarity-channel MOS transistor formed in a first-polarity-type region formed in the first-polarity-type semiconductor substrate on the main surface of the first-polarity-type semiconductor substrate, the first-polarity-type region being electrically isolated from the first-polarity-type semiconductor substrate by the second-polarity-type region.
